pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The BCL-X-like polynucleotides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations treating the normal function of protein in the body and also for treating physiological disorders and diseases. The BCL-X-like polynucleotides are useful in conjunction with polymerase chain and sequencing templates and as hybridisation probes for assessing
                                                                                                                                                                                                                                                                                                                                                                                                                                                             241 LSYSVEKTITDOVLMGVDPRGESEVKAQGFKAALVIDVTAKLTAIDNHPMNRVLGEGTKY 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to Bcl-G polypeptides and nucleic acids encoding them. The Bcl-G polypeptides can be expressed by standard recombinant specific antibodies are useful for diagnosing cancer, monitoring cancer polypeptides are useful for diagnosing cancer. The Bcl-G polypeptide. They are useful for identifying modulators, for modulating the activity of an oncogenic a level of apoptosis mediated by the Bcl-G polypeptide. A therapeutic composition comprising the Bcl-G polypeptide, Polypeptide of treating a pathology characterized by abnormal cell proliferation especially cancer. The present sequence represents a human Bcl-Gl polypeptide.
                                                                                                                                                                                                                                                                                               301 lkenfspwigqhggwekilgisheevd 327

Novel isolated human BCL-X-like polynucleotide, useful in therapeutic, diagnostic and pharmacogenic applications  $\dot{\phantom{a}}$ 

និនិន

gene expression patterns.

Sequence

252 AA;

The present sequence is human BCL-X-like protein.

The BCL-X-like polynucleotides are useful in therapeutic, diagnostic rate BCL-X-like polynucleotides. They are useful for screening drugs and pharmacogenic applications. They are useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations affective in the normal function of protein in the body and also for perturbing the normal function of protein in the BCL-X-like reacting physiological disorders and diseases. The BCL-X-like polynucleotides are useful in conjunction with polymerase chain polynucleotides are useful in conjunction with polymerase cloning reaction to screen libraries, isolate clones, to prepare cloning and sequencing templates and as hybridisation probes for assessing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14-DEC-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to Bcl-G polypeptides and nucleic acids encoding them. The Bcl-G polypeptides can be expressed by standard recombinant methodology. Bcl-G oligonucleotides (or its anti-sense strand) and Bcl-G specific antibodies are useful for diagnosing cancer. The Bcl-G second for modulating the activity of an oncogenic therapy or assessing prognosis of patients with cancer. The Bcl-G polypeptides are useful for modulating the activity of an oncogenic the second for the second for identifying modulators, for modulating polypeptide. They are useful for identifying modulators, for modulating polypeptide. They are useful for identifying modulators, a therapeutic polypeptide. They are mediated by the Bcl-G polypeptide, a therapeutic alevel of apoptosis mediated by the Bcl-G polypeptide, polynucleotide or antibody a second for treating a pathology characterized by abnormal cell is useful for treating a pathology characterized by abnormal cell approliferation especially cancer. The present sequence represents a proliferation especially cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (BURN-) BURNHAM INST
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotide encoding Bcl-G polypeptide, useful for modulating apoptosis, and for diagnosing and treating cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N-PSDB; AAH22583

Bcl-G oligonucleotides (or its anti-sense strandard recombinant therapy or assessing prognosis of patients with cancer, monitoring cancer polypeptides are useful for identifying the activity of an oncogenic composition comprising the Bcl-G polypeptide. They are useful for identifying modulators, for modulating the activity of an oncogenic composition comprising the Bcl-G polypeptide. A therapeutic is useful for treating a pathology characterized by abnormal cell proliferation especially cancer. The present sequence represents a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used number of human reproductive system related system disorders, in the prevention and treatment of reproductive system disorders in the prevention and treatment of a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 11; SEQ ID NO 4036; 1297pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids contact the probes with a collection of detectably labelled nucleic acids contact ing the expression of human breast, and then measuring the label coverifying the expression of regions of genomic DNA predicted to expression predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of the microarray of this invention presents a far greater rapid production of functional information presents a far greater corpose of the invention. Information from genomic sequence tag microarrays. The method is suitable for probe of the invention. Information from genomic sequence. The corpose of the invention, but was obtained in electronic format directly in the contact of the contact of the invention, but was obtained in electronic format directly.
                                          30-JAN-2001; 2001WO-US00669.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes for see the present invention relates to single exon nucleic acid probes for second probes in the present sequence is a protein encoded by one such a probe. The probes may be used for predicting, measuring and displaying probe. The probes may be used for predicting, measuring and incroarrays. ABA21335-ABA21369, the probes are useful for predicting, the probes are useful for predicting, the probes are useful for predicting, the gene expression, the probes are useful for predicting, the gene gene assuring gene expression, the probes are useful for predicting, the gene gene assuring gene expression, the probes are useful for predicting, the gene gene gene assuring gene expression, the probes are useful for predicting and prognosing disease. It is a probable of the printed diagnosing, and prognosing disease. It is a probable of the printed human heart and confident form part of the printed human heart sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from wife form and introduction in the probable of the printed and prognosing disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2001-488899/53

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human probes which are derived from genomic sequences expression in brain cell samples, prain. They can be used to measure gene expression in of nervous system brain. They enable the diagnosis and improved treatment of nervous system which may enable the diagnosis and improved treatment of schizophrenia, which may enable the diagnosis and improved treatment is schizophrenia, brain and cancers. The present sequence is a protein encoded by one of epilepsy and cancers. The present sequence is a protein encoded by the epilepsy and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAM66317
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 4; SEQ ID NO: 26034; 650pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human samples, which may can be used to measure gene expressed in the human such as lymphoma, Leukaemia and myeloma. The present seatment of cancers protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ry Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 4; SEQ ID NO: 26623; 658pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to human single exon nucleic acid probes by one such probe. The SENES are derived from human HeLa cells. The senesuring human gene expression in a sample derived from human HeLa cells. The SENES to epithelial cells. By measuring gene expression, the probes are the senestion and cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16 DDDINTIEBKILAYYTRHHVFKSTPALESPKLLRTRSLSORGLGNCSANESWTEVSWPCR 75

analyzing gene expression in human placenta

Claim 27; SEQ ID NO 26865; 654pp; English.

The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a human breast sample, where the probe hybridises at high stringency to a human breast sample, in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing predicting, diseases of the human breast particularly those diseases with polygenic predicting. The diseases include: breast cancer, disorders of development, diseases of the breast, fibrocystic changes, proliferative inflammatory diseases of the breast, fibrocystic changes, proliferative inflammatory disease of the breast did not form part of the printed breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from wipo at figure in the printed specification in the problem of the printed specification, but was obtained in electronic format directly from wipo specification in the problem of the printed specification in the problem of the problem of the printed specification in the problem of the prob

                                                                                                                                                                                                                                                                                                                                 Drmanac RT,
                                                                                                                                                           New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations diagnostics for genetic disorders or other traits and to assess responsible for genetic disorders or other traits.
                                                                                                                                                                                                                                                                                WPI; 2001-639362/73.
The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide chain reaction (PCR) primers, oligomers, and for chromosome polymerase chain reaction (PCR) primers, oligomers,

```
cc and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags (II). (II) is useful activity of (II) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or cc quantitating a polypeptide in tissue, as molecular weight markers and as conditional control of sites expressing (II). (I) and (II) are useful in medical cc disorders involving aberrant protein expression or biological activity. Cc diagnostics, forensics, gene mapping, identification of mutations cc anino acid sequences. Abgonolo-Aka33377 represent novel human cc assessing cc specification, but was obtained in electronic format directly from WIPO Sequence 178 AA;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed.
                                                                                                                                                                                                                                                                                                                                                                                                score greater than or equal to the score of the result bein and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is human BCL-X-like protein.

The BCL-X-like polynucleotides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of protein in the body and also for treating physiological disorders and diseases. The BCL-X-like polynucleotides are useful in conjunction with polymerase chain reaction to screen libraries, isolate clones, to prepare cloning

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   methodology. Bcl-G oligonucleotides (or its anti-sense strand) and Bcl-G specific antibodies are useful for diagnosing cancer, monitoring cancer therapy or assessing prognosis of patients with cancer. The Bcl-G polypeptides are useful for modulating the activity of an oncogenic alevel of apoptosis mediated by the Bcl-G polypeptide. They are useful for identifying modulators, for modulating composition comprising the Bcl-G polypeptide. A therapeutic is useful for treating a pathology characterized by abnormal cell proliferation especially cancer. The present sequence represents a

The Bcl-G polypeptides can be expressed by standard recombinant them. The Bcl-G polypeptides can be expressed by standard recombinant enterthodology. Bcl-G oligonucleotides (or its anti-sense strand) and Bcl-G methodology. Bcl-G oligonucleotides (or its anti-sense strand) and Bcl-G therapy or assessing prognosis of patients with cancer. The Bcl-G polypeptides are useful for modulating the activity of an oncogenic polypeptide are useful for identifying modulators, for modulating polypeptide. They are useful for identifying modulators, for modulating polypeptide of apoptosis mediated by the Bcl-G polypeptide. A therapeutic a level of apoptosis mediated by the Bcl-G polypeptide. A therapeutic suseful for treating a pathology characterized by abnormal cell is useful for treating a pathology characterized by abnormal cell proliferation especially cancer. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel polynucleotide encoding Bcl-G polypeptide, useful for modulating apoptosis, and for diagnosing and treating cancer \dot{}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 14; Fig 2; 117pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                apoptosis, and for diagnosing

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids the probes with a collection extract, and then measuring the label derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to verifying the expression of regions of gene discovery, and for encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene
                                                                                                                                                                                                                                                                                              (MOLE-) MOLECULAR DYNAMICS INC.

                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
  expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater agents of probes for measuring gene expression, with far less bias diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    printed specification, but was obtained in electronic format directly from WIPO at ftp.wlpo.int/pub/published_pct_sequences.

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21355-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SSSSSSSSSS

```

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system

                     probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                    analyzing gene expression in human bone marrow
                                                                                                                                                                                                                          (MOLE-) MOLECULAR DYNAMICS INC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12-OCT-2001 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121 nveqclehe 129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    136 NVEQCLEHE 144
                                                            The present invention relates to human single exon nucleic acid probes (SEMP: see AAI(1068-AAI(28459). The present sequence is a peptide encoded (SEMP: see that 10068-AAI(28459). The present sequence is a peptide encoded by one such probe. The SEMPs are derived from human HeLa cells. The SEMPs by one sused to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical measuring human gene expression in a sample derived from human cervical cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       30-JAN-2001; 2001WO-US00670

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Дb
                                                                                                                          The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

                   Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                        The present invention relates to novel single exon nucleic acid probes (see AAI00010-AAI10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for nucleic acid expressed in the human breast. The probes are useful for
     Sequence
                                                                       predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.
                                                                                                                                                                                                                                                                               Claim 27; SEQ ID No 10662; 322pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB85188;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse Bcl-G polypeptide.
                                      The invention relates to Bcl-G polypeptides and nucleic acids encoding them. The Bcl-G polypeptides can be expressed by standard recombinant methodology. Bcl-G oligonucleotides (or its anti-sense strand) and Bcl-G specific antibodies are useful for diagnosing cancer, monitoring cancer therapy or assessing prognosis of patients with cancer. The Bcl-G polypeptides are useful for modulating the activity of an oncogenic polypeptide. They are useful for identifying modulators, for modulating polypeptide. They are useful for identifying modulators, for modulating a level of apoptosis mediated by the Bcl-G polypeptide. A therapeutic composition comprising the Bcl-G polypeptide, polynucleotide or antibody is useful for treating a pathology characterized by abnormal cell proliferation especially cancer. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                          14-DEC-1999; 99US-0461641.

The invention provides polypeptides (AAG65886-65918) which may be peptide hormones (including insulin, growth hormones, chemokines, cytokines, hormones (including insulin, growth hormones, chemokines, cytokines, neuropeptides, integrins, kallikreins, lamins, melanins, notatuiretic neuropeptides, pituitary hormones, pleiotrophins, prostaglandins, secretogranins, selectins, thromboglobulins, thymosins) identified by secretogranins, selectins, thromboglobulins, thymosins) identified by high throughput genome-based biology and polynucleotides (AAI67176-67208) high throughput genome-based biology and polynucleotides (AAI67176-67208) high throughput genome-based biology and polynucleotides (AAI67176-67208) high throughput genome-based by standard recombinant encoding them. The polypeptides can be expressed by standard recombinant methodology. The polypeptides can be expressed by standard recombinant section as diabetes, breast-, prostate-, colon cancer and other malignant tumors, as diabetes, breast-, prostate-, colon cancer and other malignant tumors, hyper- and hypotension, obesity, bulinia, anorexia, growth abnormalities, hyper- and hypotension, obesity, bulinia, mental retardation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         24-MAR-2000; 2000US-192158P.

The polynucleotides may be used as diagnostic reagents through detecting mutations in the associated gene and for chromosome localization and for tissue expression studies. The polypeptides and polynucleotides may also be used as vaccines.

COMMENT

sequenced and submitted once, so the sequence for the remainder the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only Features listing.

ANNOTATION OF FEATURES:
STSs are identified using ePCR (Genome of a local database that includes entries local mapping efforts.
Repeats are identified using RepeatMasker (A. Res. 7:541-5 from dbSTS, 7:541-550) searches GDB, and

Smit and P. Green,

unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the as Low Coverage.

quality at URL: QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation

Direct Submission
Submitted (27-JAN-2000) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Jun 25, 2001 this sequence version replaced g1:13957543.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dugan-Rocha, S., Durbin, K.J., Earnhart, C., Edgar, D., Edwards, C.C., Elhaj, C., Escotto, M., Falls, T., Ferraguto, D., Flagg, N., Ford, J., Enster, P., Frantz, P., Gabisi, A., Gao, J., Garcia, A., Garner, T., Gazza, N., Gil, R., Gorrell, J.H., Guevara, W., Gunarthe, P., Hale, S.
                                                                                                                                                                                                                                                                                                              Center clone name: RP11-52513

Sequencing vector: Plasmid; M77789

Sequencing vector: M13; L08821
Chemistry: Dye-primer Bodipy: 7% of reads
Chemistry: Dye-terminator Big Dye: 93% of reads
Chemistry: Dye-terminator Dye: 10,000 Dye: 10,000 Dye: 10,000 Dye: 10,000 Dye-termination
Consensus quality: 208935 bases at least Q30
Estimated insert size: 199196; sum-of-contigs estimation
Quality coverage: 0x in Q20 bases; agarose-fp estimation
Quality coverage: 0x in Q20 bases; agarose-fp estimation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Davy-Carroll,L., Dederich,D.A., Delaney,K.R., Delgado,O.,

                                                                 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Quality coverage: 3.3x in Q20 bases; sum-of-contigs estimation

NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  be preserved

NOTE: This is a 'working draft' sequence. It currently consists of 64 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence

The BCL-X-like polynucleotides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of protein in the body and also for treating physiological disorders and disease. The BCL-X-like polynucleotides are useful in conjunction with polymerase chain reaction to screen libraries, isolate clones, to prepare cloning and sequencing templates and as hybridisation probes for assessing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim
